PROFESSIONAL SERVICES

SERVICES TO MEET YOUR GOALS

Our goal is to provide the tools, services and expertise to insure all your project objectives are met. Real Time Consulting offers a full range of services to provide an end-to-end solution. Our experience enables us to provide assistance in any area of the collection and documentation process to insure timely completion of your objectives.

Physical Site Survey / Data Collection

We have 15 years of experience collecting and organizing data for venues of varying types and sizes and know what it takes to efficiently collect the disparate types of data involved. When documenting a venue for planning and response applications, physical site surveys are essential to the data collection process. They establish the product's usefulness and overall value as a security tool.

By its nature, the physical site survey is the component requiring the largest investment in time and resources. We understand that some clients may not have the manpower, skills, or equipment to conduct physical surveys. We offer our services to support your requirements for data collection from beginning to end. If you have minimal resources or you simply prefer to have a professional and experienced collection team to conduct data collection, Real Time Consulting, Inc. offers the services you need to fulfill your data collection requirements in an efficient and cost effective manner.

Collaborative Design Services

We strive to ensure that one or more of our solutions will meet all of your needs. Each of our data collection tools are designed to collect pertinent information specific to your applications. We can collaborate with you to enhance any of our solutions to add the desired functionality to meet your specific data collection and publication needs.

Engineering Drawing Services

Physical site surveys are typically supported by computer-aided-design drawings, maps, charts and imagery, which are layered together to form a digital canvas onto which security assessment data is located and documented. We can assist your site survey activities by providing the graphical framework and tools you need to conduct detailed logistical and tactical analysis of geographic regions, seagoing vessels and structures.

Our experienced staff of professional CAD designers can create and assemble these essential elements, tailoring them to your specific venue. Our wealth of experience working with CAD drawings, blueprints, satellite imagery, aerial photography and cartography can be leveraged to maximize your valuable tactical planning resources.

Real Time Consulting Inc.

Custom Software Development

Video Production Services

Real Time Consulting understands the demand for instant video in crisis response situations. When seconds count, first responders can utilize our software to select video files pertinent to the situation at hand.

As a full service video production facility, Real Time Consulting provides on-site video production, post-production editing, DVD production and duplication and video encoding for Internet or CD-Rom projects.

Intranet Publishing

Real Time Consulting can work with your IT team and existing network infrastructure to incorporate the output from our products into an intranet website, complete with navigation and search capabilities. Real Time Consulting can assist in developing templates to suit your needs for the format and layout of the information that has been collected.

Once the templates are complete, production can be run at any time during data collection and the website pages are dynamically created from our software.

Planning and Response Software Training

It is important that users of the Planning and Response Software familiarize themselves with the programs operation before a situation requires its use. The last thing you want in the midst of a crisis is to use a program you have little or no experience with.

We designed the user interface of our planning and response software to be intuitive, so first time users can find the data they need with little training or guidance. Even though our software is easy to use, it is still important for users to understand the extent of the database and be comfortable with the various methods of accessing data. We offer on-site training classes to familiarize users with the software's functionality and methods of operation.

Data Collection Training/Consulting

The data collection process is not only the single largest effort of the project; it is also a process that is unfamiliar to most people. Since our collection software is actually building the product as data is collected, it is important that survey team members understand the manner and methods used to collect and organize field data.

We offer a one day, on-site training class to familiarize users with the data collection interface and the criteria for collecting attributes, coordinates, photos, motion video and 360° IPIX imagery. Training is conducted in a classroom environment that follows a curriculum.

We also offer "over-the-shoulder" consulting for data collection. Experienced Real Time Consulting personnel work with your team during collection to answer questions about the collection software and the mechanics of the collection process. Although this is not structured like our classroom training, it provides assistance as it is needed while contributing to the project's completion.
